

# JAVA 8 New Features

BY:

SUJATA BATRA

# Introduction

- ▶ JAVA 8 is a major feature release of JAVA programming language development.
- ▶ Its initial version was released on 18 March 2014.
- ▶ With the Java 8 release, Java provided supports for
  - ▶ functional programming,
  - ▶ new JavaScript engine,
  - ▶ new APIs for date time manipulation,
  - ▶ new streaming API, etc.

# Behaviour Parameterization

- ▶ Behavior parameterization is the ability for a method to take multiple different behaviors as parameters and use them internally to accomplish different behaviors.
- ▶ Behavior parameterization lets us make your code more adaptive to changing requirements and saves on engineering efforts in the future.

Sujata Bahadur

# Example

**ApplePredicate encapsulates a strategy for selecting an apple**

## //Behaviour Parameterization

```
public static List<Apple> filterApple(List<Apple> inventory, ApplePredicate p){
    List<Apple> result = new ArrayList<>();
    for(Apple apple:inventory){
        if(p.test(apple)){
            result.add(apple);
        }
    }
    return result;
}
```

**Note:** The only code really matters is implementation of the test method. Unfortunately, because filterApple method can only take objects, we have to wrap code inside an ApplePredicate object.

# Anonymous classes

- ▶ Declare and instantiate a class at the same time.
- ▶ Don't have name.
- ▶ Used to reduce verbosity and time.

**Note:** Passing code is a way to give new behaviors as arguments to a method. But it's verbose prior to Java 8. Anonymous classes helped a bit before Java 8 to get rid of the verbosity associated with declaring multiple concrete classes for an interface that are needed only once.

- ▶ The Java API contains many methods that can be parameterized with different behaviors, which include sorting, threads etc.

# Lambdas

Sujata Batra

# Lambda Introduction

- ▶ Representation of an anonymous function : it doesn't have a name, but it has a list of parameters, a body, a return type, and also possibly a list of exceptions that can be thrown.
- ▶ Can be passed around as a parameter thus achieving **behavior parameterization**.
- ▶ Let you pass code in a concise way.
- ▶ An instance of a lambda can be assigned to any **functional interface** whose single abstract method's definition matches the definition of the lambda.
- ▶ Lambda can be
  - ▶ assigned to variables
  - ▶ passed to functions

# What are Lambda's good for

- ▶ Forms the basis of functional programming
- ▶ Make parallel programming easier
- ▶ Write more compact code
- ▶ Richer data structure collection
- ▶ Develop cleaner APIs

# Syntax

- ▶ Lambda expression is composed of parameters, an arrow and a body.

- ▶ parameter -> expression body  
Or  
(parameters) -> { statements; }  
or  
() -> expression

- ▶ Following are Some examples of Lambda

```
(int a, int b) -> a * b           // takes two integers and returns their multiplication
(a, b)         -> a - b           // takes two numbers and returns their difference
() -> 99          // takes no values and returns 99
(String a) -> System.out.println(a) // takes a string, prints its value to the console, and returns
nothing
a -> 2 * a         // takes a number and returns the result of doubling it
c -> { //some complex statements } // takes a collection and do some procesing
```

# Rules for writing lambda expressions

- ▶ A lambda expression can have zero, one or more parameters.
- ▶ The type of the parameters can be explicitly declared or it can be inferred from the context.
- ▶ Multiple parameters are enclosed in mandatory parentheses and separated by commas. Empty parentheses are used to represent an empty set of parameters.
- ▶ When there is a single parameter, if its type is inferred, it is not mandatory to use parentheses. e.g. `a -> return a*a`.
- ▶ The body of the lambda expressions can contain zero, one or more statements.
- ▶ If body of lambda expression has single statement curly brackets are not mandatory and the return type of the anonymous function is the same as that of the body expression. When there is more than one statement in body than these must be enclosed in curly brackets.

# Functional Interface

Sujata Beotra

# Functional Interfaces in Java 8

- ▶ **A functional interface**, is an interface which has only a single abstract method.
- ▶ **@FunctionalInterface annotation**
  - ▶ used to explicitly specify that a given interface is to be treated as a functional interface.
  - ▶ is an *informative annotation*.

# Custom Or User defined Functional Interfaces

- ▶ Interfaces defined by the user and have a single abstract method. These may/may not be annotated by `@FunctionalInterface`.

```
package com.sujata.java8training;  
  
@FunctionalInterface  
public interface MyCustomFunctionalInterface {  
    //This is the only abstract method.Hence, this  
    //interface qualifies as a Functional Interface  
    public void firstMethod();  
}
```

# Pre-existing functional interfaces in Java prior to Java 8

- ▶ `interface java.lang.Runnable{  
 void run();  
}`
- ▶ `interface java.util.Comparator<T>{  
 int compare(T o1,T o2)  
}`

Sujata Batra

# Newly defined functional interfaces in Java 8

- ▶ These are pre-defined Functional Interfaces introduced in Java 8 in `java.util.function` package.
- ▶ They are defined with generic types and are re-usable for specific use cases.
- ▶ One such Functional Interface is the `Predicate<T>` interface which is defined as follows –

```
//java.util.function.Predicate<T>  
@FunctionalInterface  
public interface Predicate<T> {  
    boolean test(T t);  
}
```

# Java 8 java.util.function package

- ▶ Provides a set of re-usable common functional interfaces( and their corresponding lambda) definitions which can be used by the programmer in his code instead of creating brand new functional interfaces.
- ▶ 4 major Categories
  - ▶ Consumer<T>
    - ▶ Used in all contexts where an object T needs to be consumed,i.e. taken as input, and some operation is to be performed on the object without returning any result.
  - ▶ Function<T,R>
    - ▶ Used when an object of a type T is taken as input and it is converted(or mapped) to another type R.
  - ▶ Predicate<T>
    - ▶ Used wherever an object T needs to be evaluated and a boolean value needs to be returned
  - ▶ Supplier<T>
    - ▶ Used in all contexts where there is no input but an output T is expected.

# Common Functional Interfaces in Java8

Functional Interface	Functional Descriptor	Primitives Specializations
Predicate<T>	T -> Boolean	IntPredicate, LongPredicate, DoublePredicate
Consumer<T>	T -> void	IntConsumer, LongConsumer, DoubleConsumer
Function<T, R>	T -> R	IntFunction<R>, IntToDoubleFunction, IntToLongFunction, LongFunction<R>, LongToDoubleFunction, LongToIntFunction, DoubleFunction<R>, ToIntFunction<T>, ToDoubleFunction<T>, ToLongFunction<T>
Supplier<T>	() -> T	BooleanSupplier, IntSupplier, LongSupplier, DoubleSupplier
UnaryOperator<T>	T -> T	IntUnaryOperator, LongUnaryOperator, DoubleUnaryOperator

# Common Functional Interfaces in Java8

Functional Interface	Functional Descriptor	Primitives Specializations
BinaryOperator<T>	(T, T) -> T	IntBinaryOperator, LongBinaryOperator, DoubleBinaryOperator
BiPredicate<L, R>	(L, R) -> boolean	
BiConsumer<T, U>	(T, U) -> void	ObjIntConsumer<T>, ObjLongConsumer<T>, ObjDoubleConsumer<T>
BiFunction<T, U, R>	(T, U) -> R	ToIntBiFunction<T, U>, ToLongBiFunction<T, U>, ToDoubleBiFunction<T, U>

# Type Checking, type inference

- ▶ Type Checking:

- ▶ Type of lambda is deduced from the context in which lambda is used.

**Note:** The type expected for the lambda expression inside the context is called the **target type**.

- ▶ Type Inference:

- ▶ Java compiler also deduce an appropriate signature from the lambda because the function descriptor is available through the target type.

# Using Local variables in Lambda

- ▶ lambda expressions are also allowed to use free variables (variables that aren't the parameters and defined in an outer scope), such lambdas are called **capturing lambdas**.
- ▶ Lambdas are allowed to capture (that is, to reference in their bodies) instance variables and static variables **without restrictions**.
- ▶ local variables have to be explicitly declared **final** or are **effectively final**.

# Method References

- ▶ Used to refer method of functional interface.
- ▶ Compact and easy form of lambda expression.
- ▶ when using lambda expression to just referring a method, replace lambda expression with method reference.xxxxxxx

## Example

**//Lambda Expression**

```
Function<String,Integer> intParser = (String str,Integer integer)->Integer.parseInt(str)
```

**//Method Reference**

```
Function<String,integer> intParser=Integer::parseInt
```

# Method References

Sujata Batra

# Types of Method Reference

- ▶ Reference to a static method.
- ▶ Reference to an instance method.
- ▶ Reference to a constructor.

Sujata Batra

# Type 1: Reference to a static method

## ► Lambda Syntax:

- (arguments) -> <ClassName>.<staticMethodName>(arguments);

## ► Equivalent Method Reference:

- <ClassName> :: <staticMethodName>

## Example

//Lambda Expression

```
Function<String, Double> doubleConvertorLambda=(String s) ->Double.parseDouble(s);
```

//Equivalent Method Reference

```
Function<String, Double> doubleConvertor=Double::parseDouble;
```

# Type 2: Reference to an instance method of an arbitrary type

- ▶ Lambda Syntax
  - ▶ `(arg0,rest)->arg0.instanceMethod(rest)`  
Note: `arg0` is of type `ClassName`
- ▶ **Equivalent Method Reference:**
  - ▶ `ClassName of arg0 ::instanceMethod`

# Type 2: Example

```
List <String> str=Arrays.asList("a","b","A","B");
```

```
//Lambda
```

```
str.sort((s1,s2)->s1.compareToIgnoreCase(s2));
```

```
//Equivalent Method Reference
```

```
str.sort(String::compareToIgnoreCase);
```

# Type 2: Reference to an instance method

- ▶ **Lambda Syntax:**

- ▶ (arguments) -> <expression>.<instanceMethodName>(arguments)

- ▶ **Equivalent Method Reference:**

- ▶ <expression> :: <instanceMethodName>

Sujata Batra

# Type 2 :Example

```
interface Sayable{
    void say();
}

public class InstanceMethodReference {
    public void saySomething(){
        System.out.println("Hello, this is non-static method.");
    }
    public static void main(String[] args) {
        InstanceMethodReference methodReference = new InstanceMethodReference(); // Creating object
        //lambda
        Sayable sayablex=()->{methodReference.saySomething()};
        // Referring non-static method using reference
        Sayable sayable = methodReference::saySomething;
        // Calling interface method
        sayable.say();
        // Referring non-static method using anonymous object
        Sayable sayable2 = new InstanceMethodReference()::saySomething; // You can use anonymous object also
        // Calling interface method
        sayable2.say();
    }
}
```

# Type 3: Reference to a Constructor

- ▶ **Syntax of Constructor References:**

- ▶ <ClassName>::new

- ▶ Type 3: Example

```
public class Employee{  
    String name;  
    Integer age;  
    //Constructor of employee  
    public Employee(String name, Integer age){  
        this.name=name;  
        this.age=age;  
    }  
}
```

# Type 3 : Example

```
public interface EmployeeFactory{  
    public Employee getEmployee(String name,Integer age);  
}
```

**//Client Code for invoking Factory Interface**

**//lambda Example**

```
EmployeeFactory empFactory=(name,age)-> new Employee(name,age);
```

**//Equivalent Method Reference**

```
EmployeeFactory empFactory=Employee::new;
```

```
Employee emp= empFactory.getEmployee("John Hammond", 25);
```
